Alkenes and alkynes are privileged building blocks in synthetic organic chemistry, allowing the simultaneous introduction of different functional groups via addition of two different functional groups across the  $\pi$ -system.<sup>1</sup> Late transition metals play a prominent role in these transformations. Here, we present Au, Ag and Cu-catalyzed reactions accomplishing the functionalization of these simple building blocks. Both, oxidative cross-coupling as well as, radical mediated reactions have been discovered as valuable tool to access densely functionalized structures.<sup>2</sup>
